Descriptive Analytics Report: Swiggy

Daily Order Behavior at Scale

Name: Rehan Ansari
Roll no: 1250258268
Course: BCA (DS& AI)
Section: BCADS24
Date: 15 August, 2026

Tracking Order Trends, Cuisine Categories, Success Rates, Regional Demand & Customer Experience

Note on data: This report uses the supplied Swiggy dataset containing 950 order-level records spanning 180 dates (2026-01-01 to 2026-06-29), 6 cities and 8 cuisine categories. Unlike a pre-aggregated summary, this dataset is raw, order-level transaction data, so the daily and category-level metrics below are computed directly by aggregating individual orders. The analysis describes the supplied observations and does not assume a larger real-time Swiggy order stream.

1. Objective

Build a descriptive analytics layer over Swiggy order data to answer the following recurring business questions:

- How are daily order volumes trending over time?
- How is daily GMV (order value) trending over time?
- Which cuisine category contributes the highest order volume?
- Which cuisine categories contribute the most to overall GMV?
- Which cities generate the highest order volumes?
- Which cities contribute the most GMV?
- Successful order (complaint-free) level.
- City level order demand geographically.
- How does delivery time relate to order value and customer rating?
- Weekday and weekend order patterns.
- Customer Satisfaction (CSAT).
- Payment method preferences, Swiggy One membership impact, and discount effectiveness.

2. How This Would Work at Real Scale

Processing large-scale food-delivery order events is an engineering problem before it is an analytics problem. A realistic architecture would collect order events, aggregate them by time/cuisine/city, store raw and processed data, and expose the resulting KPIs through a data visualization layer.

Layer	**Purpose**	**Typical tools**
Investigation	Research, understand and prepare the order dataset	Google, Claude & Chat GPT
Stream processing	Aggregate by cuisine, city and time	JUPYTER notebook (python)
Storage	Retain raw and processed data	Excel files/CSV files
Batch aggregation	Daily KPI and summary metrics	JUPYTER Notebook
Report	Present analysis, graphs and insights	Data Visualization/MS Word

3. Daily Order Volume

Over the supplied 180-day window (2026-01-01 to 2026-06-29), the dataset records 950 orders and approximately ₹337,009.24 in GMV. The daily charts below show how order volume and GMV move across the available dates.

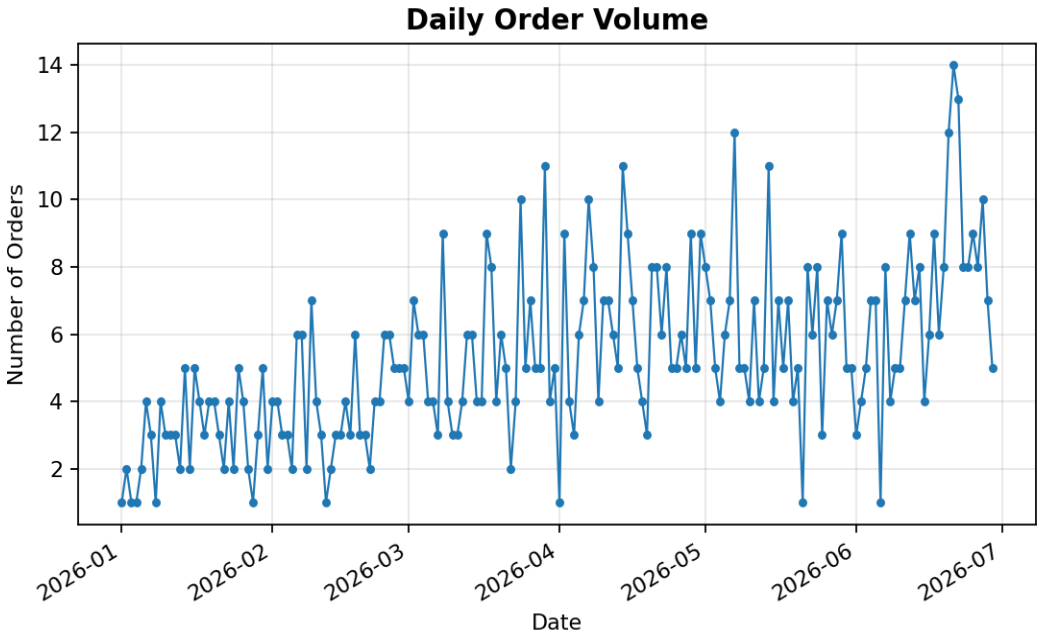

Figure 1. Daily order volume

INSIGHTS:

- Higher-volume dates indicate periods of stronger order activity.
- Lower-volume dates indicate comparatively weaker activity.
- Monitoring daily order volume can help identify demand fluctuations.
- This can support operational and delivery-fleet capacity planning.

KPI:

Total orders: 950

Average daily orders: 5.28

Peak daily orders: 14 (on 2026-06-21)

4. Daily GMV Trending Over Time

Total GMV in the supplied records is ₹337,009.24. The average GMV per represented date is ≈₹1,872.27 while the highest daily aggregate GMV is ≈₹4,637.22 (on 2026-06-21). GMV is calculated directly from the dataset's Order_Value_INR field.

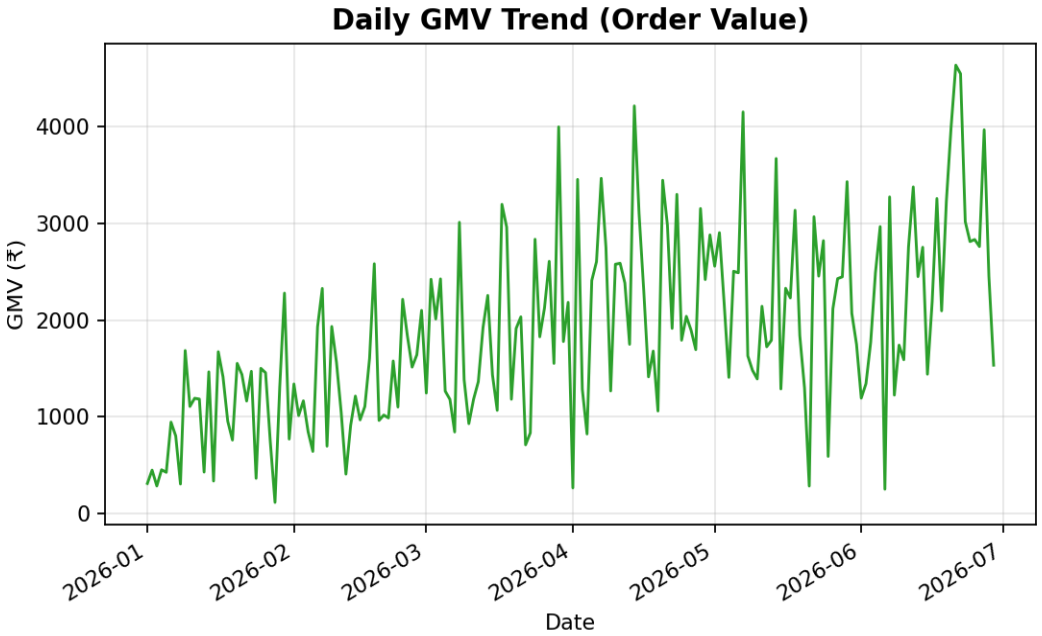

Figure 2. Daily GMV trend

INSIGHTS:

- GMV varies across the available dates.
- Higher GMV indicates stronger monetary order activity.
- Daily GMV monitoring helps identify high-value order periods.
- GMV should be considered alongside order volume to understand demand more completely.

KPI:

Total GMV: ₹337,009.24

Average GMV per date: ≈₹1,872.27

Peak daily GMV: ≈₹4,637.22

Average order value (AOV): ₹354.75

5. Best-Performing Cuisine Categories

The supplied dataset spans 8 cuisine categories. North Indian is the top category by order volume, with 175 orders (18.42% of all supplied orders). Unlike a single-category dataset, this comparison is meaningful because multiple cuisine categories are represented.

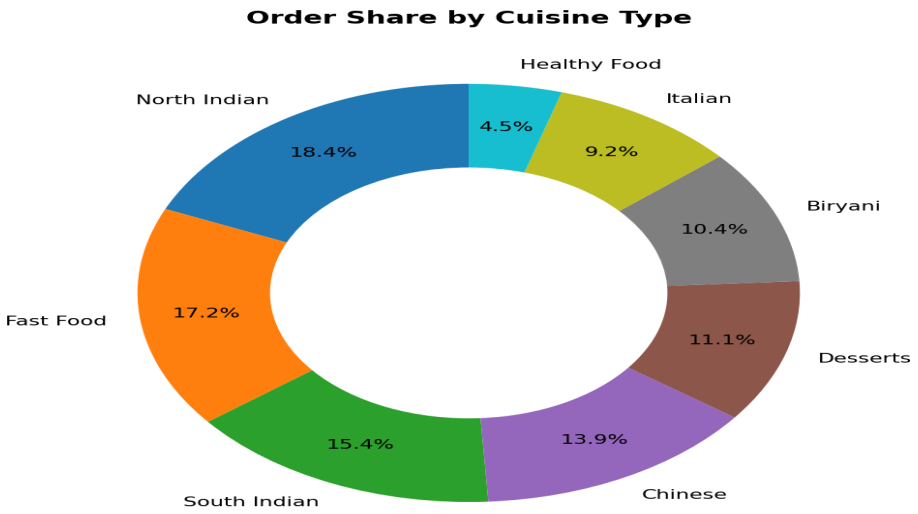

Figure 3. Order share by cuisine type

INSIGHTS:

- Order demand is spread across multiple cuisine categories rather than concentrated in one.
- North Indian leads in raw order count, indicating strong everyday demand.
- The remaining categories still contribute meaningfully and should not be ignored in menu/merchant planning.
- This distribution can guide restaurant partner onboarding and cuisine-specific promotions.

KPI:

Top cuisine category (orders): North Indian

Orders: 175

Order share: ≈18.42%

Categories represented: 8

6. Cuisine Categories' Contribution to Overall GMV

By GMV, North Indian is again the leading category, contributing ₹77,128.22 (22.89% of total GMV). This is notable because North Indian leads on both order volume and GMV, suggesting both high popularity and healthy average order values.

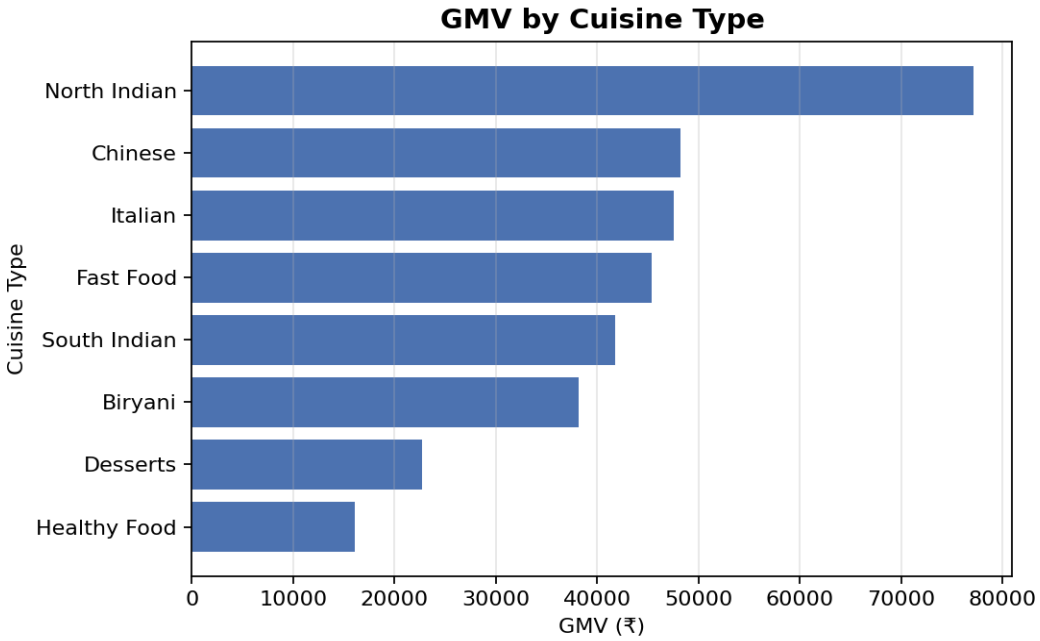

Figure 4. GMV by cuisine type

INSIGHTS:

- GMV leadership does not always match order-volume leadership, so both views are useful together.
- A cuisine category with fewer orders but a higher GMV share indicates a higher average order value.
- GMV-by-category analysis can support commission and promotional strategy by cuisine.
- The finding should be interpreted within the supplied dataset window.

KPI:

Top cuisine category (GMV): North Indian

GMV: ₹77,128.22

GMV share: ≈22.89%

7. Cities That Generate the Highest Order Volumes

Mumbai is the largest city-level contributor by order volume, with 205 orders (21.58% of all supplied orders). Mumbai is also the largest contributor by GMV, at ₹79,178.84. The distribution shows that demand is concentrated in a subset of cities rather than evenly distributed.

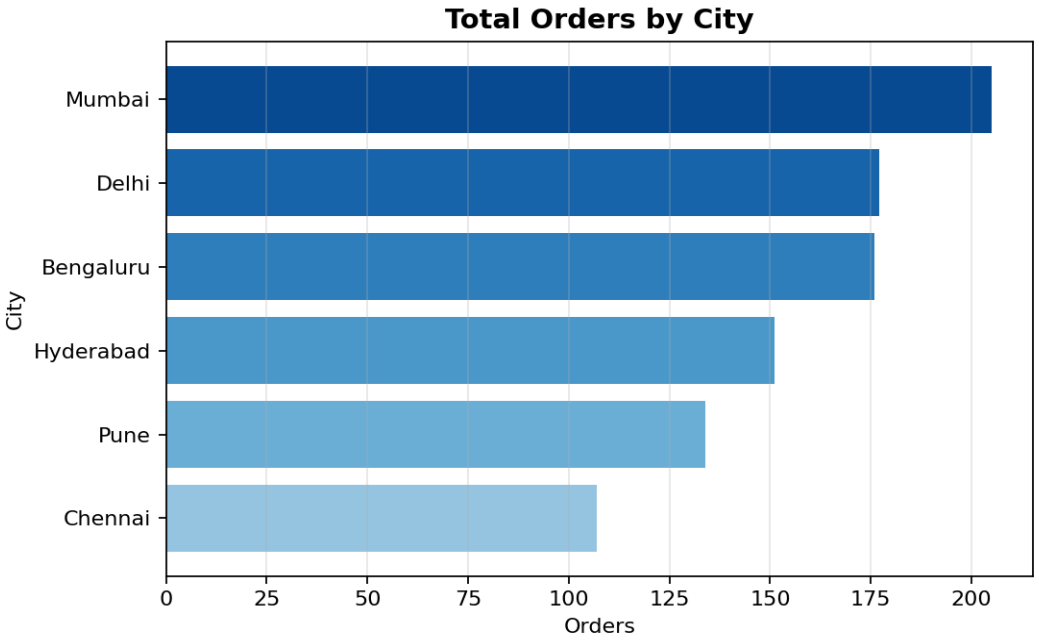

Figure 5. Total orders by city

INSIGHTS:

- Order demand is concentrated among a smaller set of metro cities.
- Demand is not evenly distributed across all cities in the dataset.
- High-volume cities may require greater delivery-partner and operational support.
- City-level order analysis can help with regional business planning.

KPI:

Top-performing city: Mumbai

Recorded orders: 205

Share of total orders: ≈21.58%

8. Cities That Contribute the Most GMV

Mumbai is also the largest contributor by GMV, at ≈₹79,178.84 (23.49% of total GMV). The distribution shows that GMV, like order volume, is concentrated in a subset of cities rather than evenly distributed.

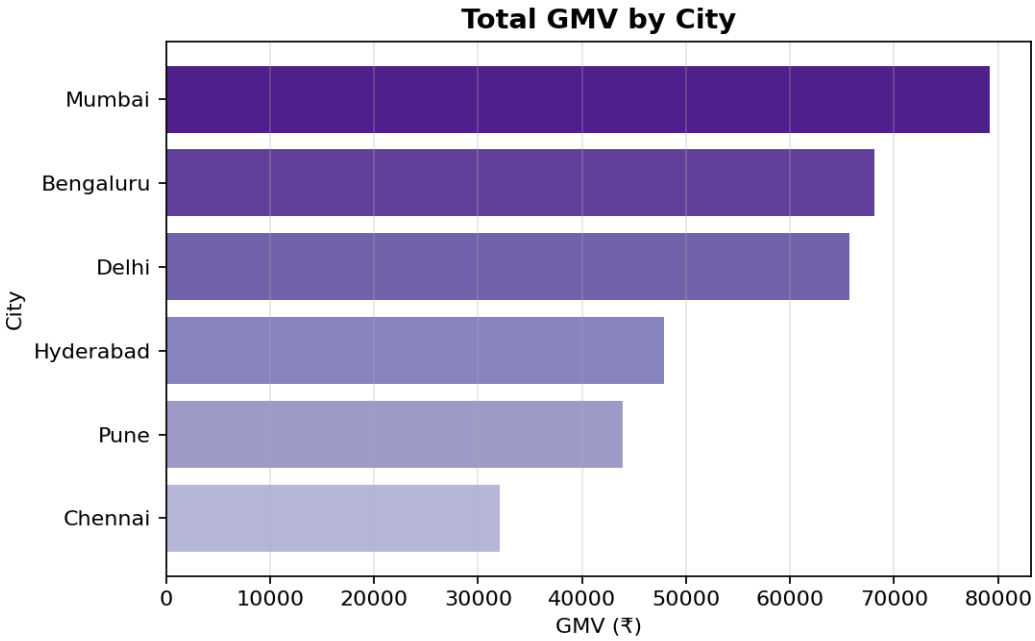

Figure 6. Total GMV by city

INSIGHTS:

- This indicates strong monetary order activity in the leading cities.
- GMV is concentrated in a subset of cities.
- High-GMV cities can be important markets for operational and service planning.
- City-level GMV analysis can help identify commercially important regions.

KPI:

Top-performing city (GMV): Mumbai

Recorded GMV: ≈₹79,178.84

GMV share: ≈23.49%

9. City-Level Order Demand

Mumbai is the largest state-level contributor by order volume, with 205 orders (21.58% of all supplied orders). The distribution shows that demand is concentrated in a subset of cities rather than evenly distributed.

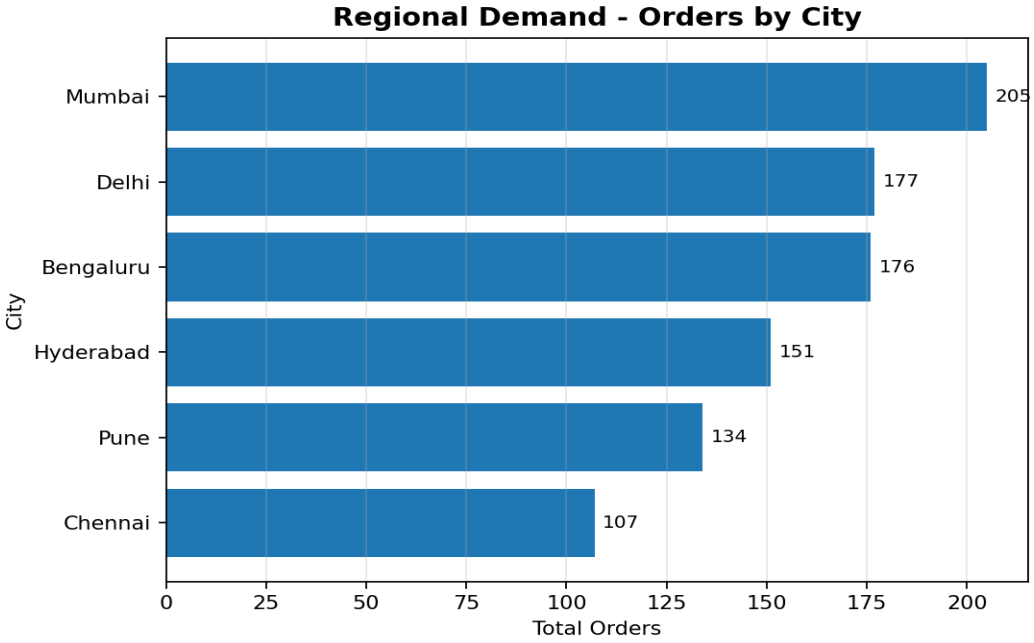

Figure 7. City-level order demand

INSIGHTS:

- Demand is distributed across 6 cities.
- Mumbai therefore represents the strongest demand market in the graph.
- City-level demand information can support delivery-fleet coverage decisions.
- It can also support operational planning and service monitoring.
- Comparing cities helps identify areas requiring greater business attention.

KPI:

Top-performing city: Mumbai

Order volume: 205

Cities covered: 6

10. Success Rate

Using complaint-free orders as a proxy for successful order fulfilment, the average order success rate across the supplied records is 91.68% (8.32% of orders had a complaint raised).

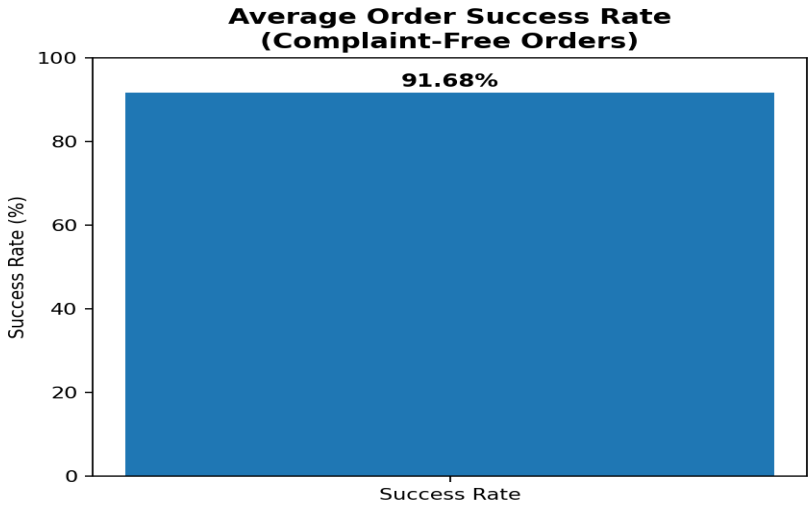

Figure 8. Average order success rate

INSIGHTS:

- City-level differences: the complaint-rate breakdown (Section 15) can reveal which cities have relatively higher or lower success rates.
- Success rate should be monitored continuously because changes may indicate operational issues.
- The average CSAT score is 4.47/5. Success rate is an operational reliability metric, whereas CSAT reflects the customer experience captured in the dataset.

KPI:

Average order success rate: 91.68%

Operational status: High order reliability

Complaint rate: 8.32%

11. Regional Demand

Order demand is distributed across 6 cities. Mumbai has the highest order volume in the supplied data at 205 orders. Regional demand analysis can support delivery-fleet coverage, operational planning, service monitoring and city-level business decisions.

City	Orders	GMV (₹)	Order Share	GMV Share	Avg. Rating
Mumbai	205	79,178.84	21.58%	23.49%	4.44
Delhi	177	65,717.42	18.63%	19.50%	4.51
Bengaluru	176	68,129.34	18.53%	20.22%	4.43
Hyderabad	151	47,924.88	15.89%	14.22%	4.52
Pune	134	43,938.48	14.11%	13.04%	4.50
Chennai	107	32,120.28	11.26%	9.53%	4.43

INSIGHTS:

- Regional demand can support delivery-partner coverage planning.
- It can also help with operational planning and service monitoring.
- City-level demand information can support regional business decisions.

12. Delivery Time vs Order Value and Rating

The relationship between delivery time, order value, and customer rating provides an additional descriptive view of service quality. The average delivery time across supplied orders is 37.24 minutes. The correlation between delivery time and customer rating is -0.34, which should be interpreted as an association rather than proof of causation.

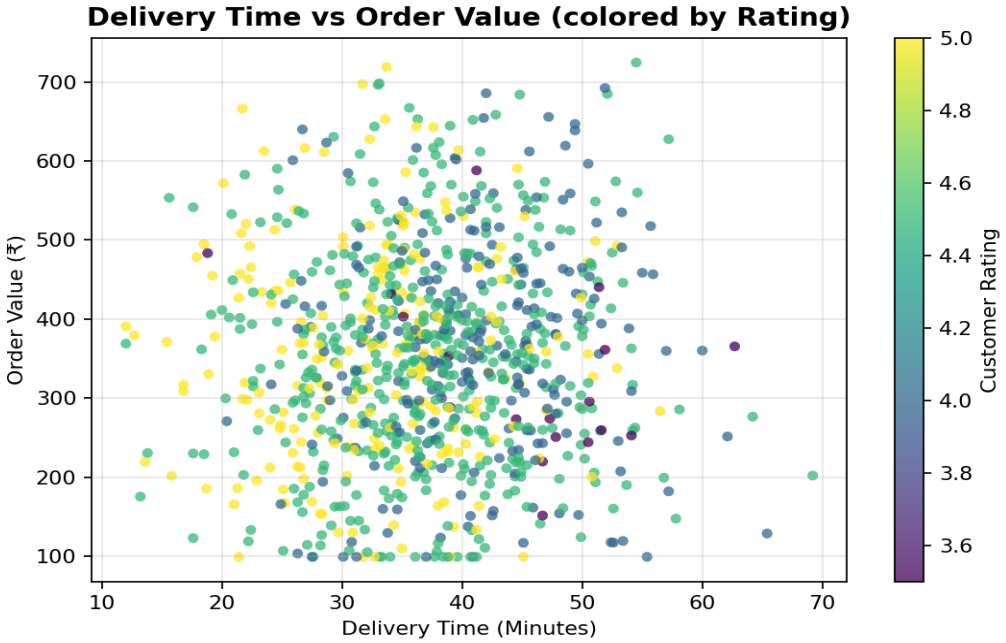

Figure 9. Delivery time vs order value, colored by rating

INSIGHTS:

- A negative correlation between delivery time and rating may indicate that longer deliveries are associated with lower customer satisfaction.
- However, the chart does not prove that delivery time alone causes rating differences.
- Other factors (order size, cuisine, city traffic) can also influence customer rating.
- This analysis can support delivery-time optimization and service-level planning.

KPI:

Average delivery time: 37.24 minutes

Delivery time – rating correlation: -0.34

Relationship: Weak-to-moderate negative association in the supplied data

13. Weekday vs Weekend Order Pattern

Across the row-level observations, average orders are 5.34 on weekdays versus 5.12 on weekends (orders per active day). Average GMV per active day is ₹1,877.63 on weekdays versus ₹1,859.09 on weekends.

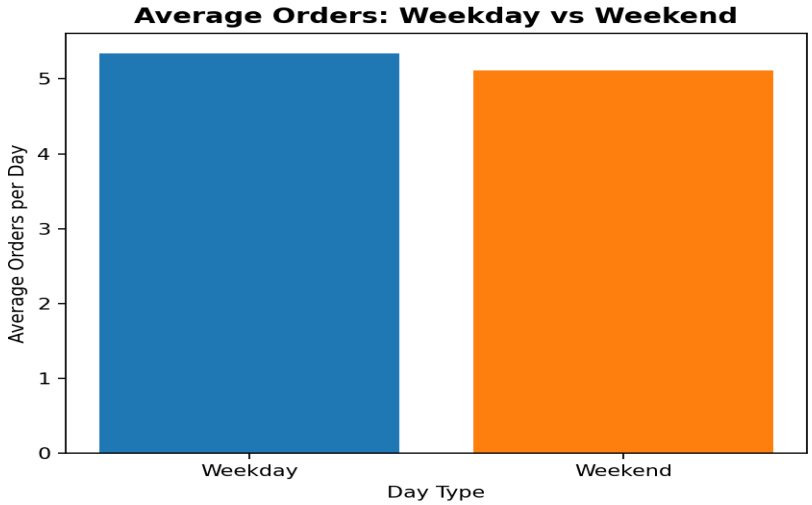

Figure 10. Weekday vs weekend orders

INSIGHTS:

- The dataset is not a complete continuous daily series for every city/cuisine combination.
- Therefore, the result should be treated as a descriptive comparison of the available observations.
- Weekday and weekend patterns can help inform delivery-staffing schedules.

KPI:

Average weekday orders/day: 5.34

Average weekend orders/day: 5.12

Average weekday GMV/day: ₹1,877.63

Average weekend GMV/day: ₹1,859.09

14. Customer Satisfaction (CSAT)

The overall row-level average CSAT (Customer Rating) is 4.47/5. Hyderabad has the highest average CSAT at 4.52, while Bengaluru has the lowest at 4.43. CSAT is useful as a customer-experience KPI alongside operational measures such as success rate.

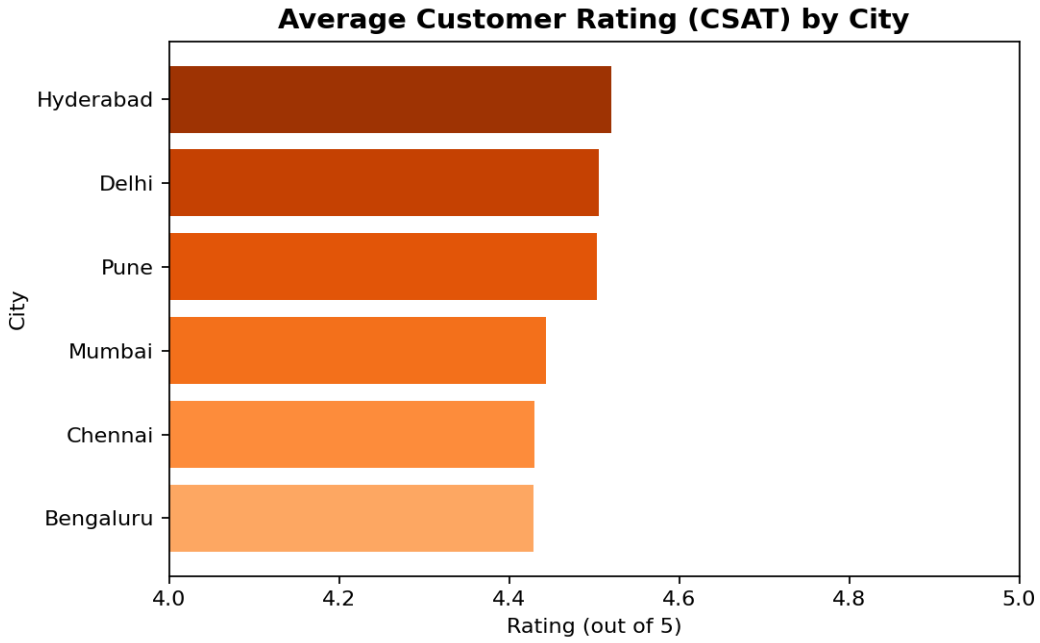

Figure 11. Average customer rating (CSAT) by city

INSIGHTS:

- This shows some variation in customer satisfaction between cities.
- Hyderabad represents the strongest CSAT performance among the cities shown.
- Bengaluru may require closer investigation to understand its comparatively lower score.
- CSAT should be considered alongside operational KPIs such as success rate and delivery time.

KPI:

Highest CSAT city: Hyderabad

CSAT: 4.52 / 5

Lowest CSAT city: Bengaluru

CSAT: 4.43 / 5

15. Payment Method Preferences

The supplied dataset records four payment methods. UPI is the most-used payment method, accounting for 54.84% of all orders.

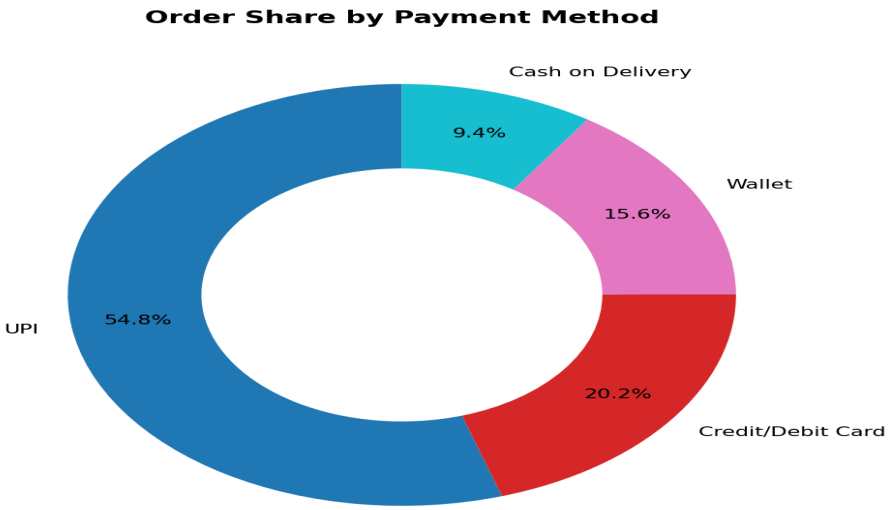

Figure 12. Order share by payment method

INSIGHTS:

- Digital-first payment methods dominate order volume in the supplied data.
- Payment-method mix can inform partnerships with payment providers and checkout UX priorities.
- Cash on Delivery still represents a minority share, useful for markets with lower digital-payment penetration.

KPI:

Top payment method: UPI

Share of orders: ≈54.84%

16. Swiggy One Membership Impact

Swiggy One members account for 295 orders (31.05% of all orders) in the supplied data. The average order value for members is ₹351.87, compared with ₹356.04 for non-members.

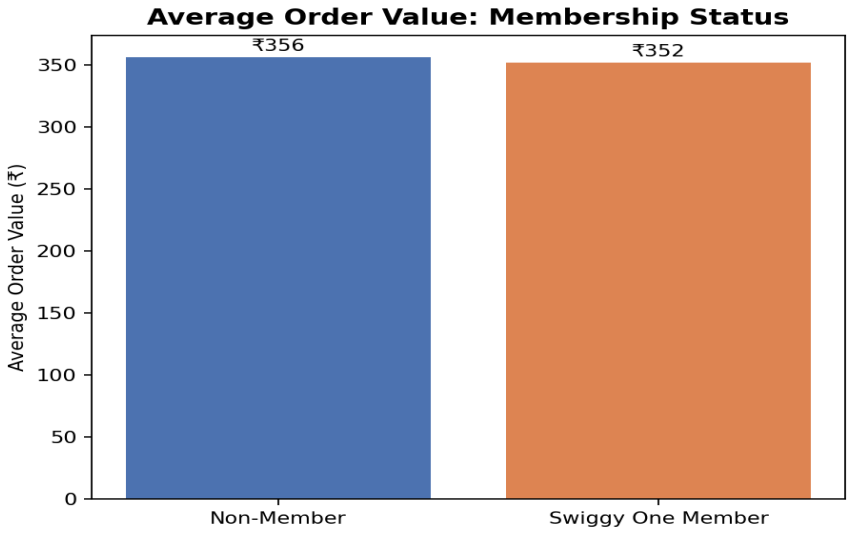

Figure 13. Average order value by membership status

INSIGHTS:

- Average order value is broadly similar between members and non-members in this dataset.
- Membership share indicates roughly one in three orders in the sample comes from a Swiggy One member.
- A larger, longer-horizon dataset would be needed to confirm any lasting AOV differences by membership.

KPI:

Swiggy One member orders: 295 (31.05%)

Member AOV: ₹351.87

Non-member AOV: ₹356.04

17. Discount Usage & Impact on Reorder Intent

A discount was used in 491 orders (51.68% of all orders), with an average discount amount of ₹67.24 where applied. Reorder intent is 93.28% among discounted orders versus 93.68% among non-discounted orders.

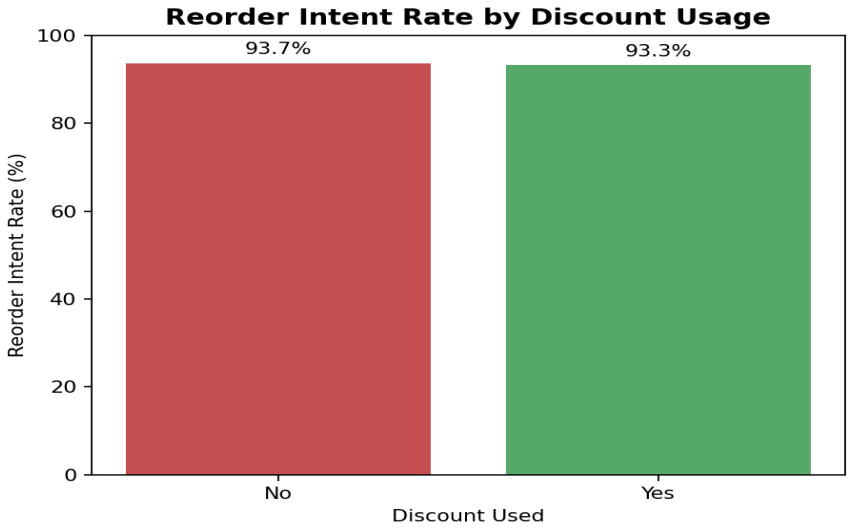

Figure 14. Reorder intent rate by discount usage

INSIGHTS:

- Reorder intent is high overall, regardless of discount usage, in the supplied sample.
- Discounts do not show a strong standalone effect on reorder intent here; other factors likely dominate.
- Discount-usage patterns can still support promotional budget planning at the cuisine or city level.

KPI:

Orders with discount applied: 491 (51.68%)

Average discount amount: ₹67.24

Overall reorder intent: 93.47%

18. Complaint Rate by City

Complaint rates vary by city. Chennai has the highest complaint rate at 11.21%, while Pune has the lowest at 5.97%.

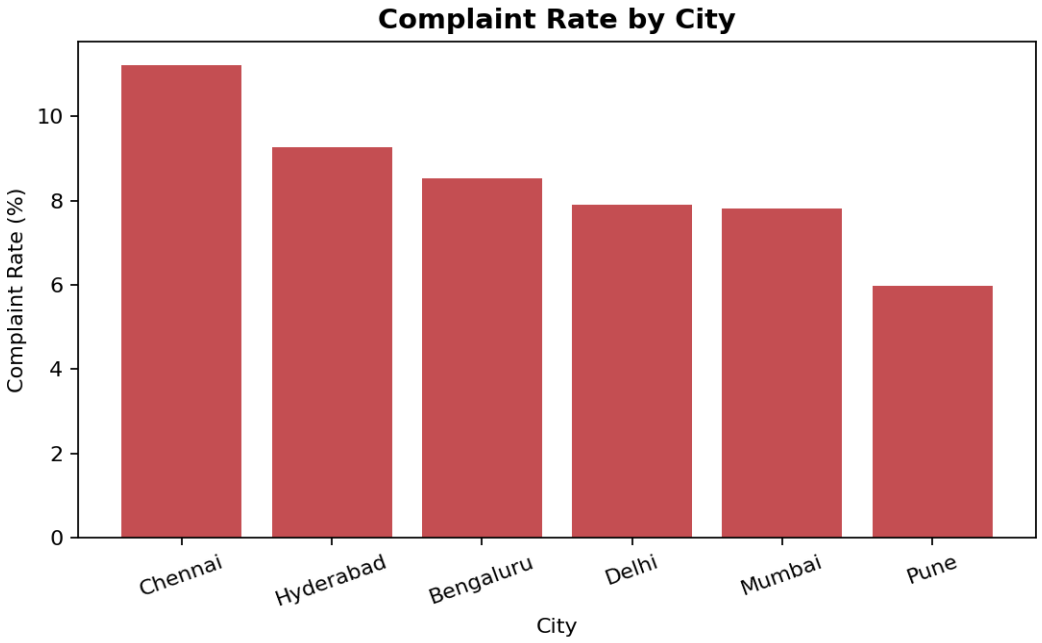

Figure 15. Complaint rate by city

INSIGHTS:

- Cities with higher complaint rates may need closer investigation into delivery or service quality.
- Complaint rate is a useful complement to CSAT and success-rate metrics.
- This can support targeted operational improvements at the city level.

KPI:

Highest complaint-rate city: Chennai

Complaint rate: 11.21%

Lowest complaint-rate city: Pune

Complaint rate: 5.97%

Summary of Key Metrics

Metric	Value
Total orders	950
Total GMV	₹337,009.24
Average order value (AOV)	₹354.75
Average success rate (complaint-free)	91.68%
Average CSAT score	4.47 / 5
Cities tracked	6
Cuisine categories tracked	8
Dataset records	950
Complaint-flagged orders	79

Next Steps to Move from Descriptive → Predictive

- Demand forecasting by cuisine category and city to estimate future order volumes.
- Anomaly detection for sudden changes in success rate, GMV or order volume.
- Churn/retention modelling linking complaint history and CSAT to reorder behavior.
- Delivery-partner productivity analysis using orders per active delivery slot/city.
- Trend and cohort analysis when longer historical data becomes available.

This report answers what happened in the supplied dataset. The next analytical layer would use a longer time period and richer event-level data to explain why changes occurred and to forecast what is likely to happen next.

Glossary:

I. GMV — Gross Merchandise Value: Total monetary value of orders processed through a platform before deducting fees, discounts, refunds, or other adjustments. The exact definition can vary by dataset/platform.

II. AOV — Average Order Value: The average monetary value of a single order, calculated as total GMV divided by total order count.

III. UPI — Unified Payments Interface: India's instant, real-time payment system developed by NPCI that enables bank-account-to-bank-account payments.

IV. Swiggy One: Swiggy's paid membership program offering benefits such as free or discounted delivery on eligible orders.

V. CSAT — Customer Satisfaction Score: A customer-experience metric usually collected through post-order ratings, often asking customers to rate their satisfaction on a 5-point scale.
